

ABSTRACT

~~The present invention relates to a~~ ^A combined roller and push switch assembly, ^{includes} comprising a substantially hollow wheel-like roller member being displaceable from an initial position to a displaced position. The combined roller and push switch assembly further ~~comprises~~ ^{includes} a member ^{means} for returning the roller member from the displaced position to the initial position, the returning ^{member is} means comprising a resilient member being at least partly encircled by the roller member, and ^{means} ~~means~~ ^{means} for detecting rotation of the roller member in relation to an associated frame. In particular, the combined roller and push switch assembly further ^{including a} comprising switching means ~~means~~ for indicating when the roller member is in the displaced position, the switching ~~means~~ ^{means} being at least partly encircled by the roller member.
